- DL-S series
- DL series
- DLA series

Background suppression photo sensors

Unlike the conventional diffuse-reflective type photo sensors that operate based on received light intensity, background suppression photo sensors employ a ranging method based on the principle of triangular distance measurement.

For this reason, detection is less affected by the soiling of the lens surface, color of the detection object, objects in the background, etc. and therefore, higher stability is ensured.

List of models

Type	Appearance (Typical example)	Model	Detecting distance					See page	
			50mm	100mm	500mm	1m	2m		
Self-teaching		DA-S40R(-J)	70~400mm					330	
		DA-S70(-J)	70~700mm						
		DA-S100RP	0.2~1m					334	
		DA-S100RTC							
		DA-S200P	0.2~2m						
		DA-S200TC							
Phase difference detection		DX-7AH	0.5~7.5m						342
Short-range		DL-S3R	10~30mm						348
		DL-S3							
		DL-S4R	10~40mm						
		DL-S4							
		DL-S5R	10~50mm						
		DL-S5							
Medium-range		DL-S10R	10~100mm					354	
		DL-S10							
		DL-S15	10~150mm						
		DL-S20							
Long-range, slim		DL-S100R(-J)	0.2~1m					354	
		DL-S202(-J)	0.2~2m						
Long-range, low-cost		DL-S100P(TC)	0.2~1m					360	
		DL-S200P(TC)	0.2~2m						
Analog output		DLA-S150	50~150mm					362	
		DLA-S300	150~300mm						
		DLA-S1000	0.2~1m						
		Reflector type DSM-500	0.5~6m						

Background suppression photo sensors

Characteristics shared by background suppression sensors

1 Less influence of background

Unwanted light reflection from the background of the detecting object is less likely to affect detection.

No more restrictions on installation

2 Resistance to soiling of lens or work

Stable detection ensured in adverse environment

3 Less influence of color, shape and material of objects

A white object with high reflectance and black object with low reflectance are detected at a similar distance. Objects in mixed colors or undergoing color change can be stably detected.

Applications

<ul style="list-style-type: none"> Detection of presence of CDs in transfer 	<ul style="list-style-type: none"> Detection of wafer carrier (in vacuum chamber) 	<ul style="list-style-type: none"> Suction grip check on lettuce wrapping machine

For Correct Use

Be sure to follow the instructions in the operation manual provided for correct use of the product.

Panel display and functions

No.	<Name> Function description
(1)	<Operation indicator (O.P)> The orange LED is illuminated to indicate operation
(2)	<Stability indicator (STB)> The green LED is illuminated when the received light level is in a range that allows stable activation (120% or higher of the activation level) or stable deactivation (80% or lower of the activation level). The stability indicator does not show the margin of distance but intensity of light with reference to the operation level. The distance at which the indicator is illuminated may vary depending on the reflectance of the detection object. Situations in which the stability indicator is not illuminated may cause unstable detection.
(3)	<Error indicator (ERR)> The Red LED is illuminated or flashes if any error occurs during teaching.
(4)	<SET/RUN selector switch> [SET] setting allows teaching (distance setting). [RUN] setting activates the sensor at the distance stored with [SET].
(5)	<Set button switch (SET)> Pressing the Set button with the selector switch at [SET] enables distance teaching.
(6)	<ZONE/NOR. selector switch> [ZONE] setting enables operation in the range between the 2 teaching points (set distance). [NOR] setting enables operation between the teaching point (set distance) and the sensor.
(7)	<D.ON/L.ON selector switch> [D.ON] setting enables the following operation: Activated outside of the detecting range in the ZONE mode. Activated when a certain amount of light is not receive in the NOR mode. [L.ON] setting enables the following operation: Activated in the detecting range in the ZONE mode. Activated when a certain amount of light is received in the NOR mode.
(8)	<ON DLY/OFF DLY selector switch> [ON DLY] setting enables the on-delay timer. [OFF DLY] setting enables the off-delay timer.
(9)	<Delay time adjustment volume (TIME)> MIN(S) setting overrides the delay and enables normal on/off operation.
(10)	<Terminal block> For the DA-S100R/200 Series only.

Teaching pattern and detection setting

Four teaching patterns are available:

- (1) NOR mode 1-point teaching
- (2) NOR mode 2-point teaching
- (3) ZONE mode teaching
- (4) Maximum distance (default) teaching

The following section provides applications, setting procedure, sensor operation and notes.

(1) NOR mode 1-point teaching and applications

This type of setting is suitable for detection in which it is difficult to provide the detection object at a specific place and the background (reflecting object such as wall and conveyor) is within the sensor detecting range.

Applications: detection of object on conveyor or on this side of the background

Setting procedure

- 1) Set the ZONE/NOR selector switch to [NOR].
- 2) Set the SET/RUN selector switch to [SET].

The operation indicator (orange LED) starts flashing.

- 3) Press the SET button with the background only.

The stability indicator (green LED) is illuminated when the SET button is pressed.

Release the SET button when the stability indicator (green LED) is illuminated.

Note: Holding down the button enables the maximum distance teaching mode.

When the SET button is released, the stability indicator (green LED) stays illuminated and the operation indicator (orange LED) starts flashing.

Teaching (distance setting) is complete.

- 4) Set the SET/RUN selector switch to [RUN].

Operation

- The detecting range is within the set detecting distance.
- The set activation position is within about 20% on this side of the background.
- Set the operation mode by selecting between L.ON and D.ON.

(2) NOR mode 2-point teaching and applications

Use the actual detection object for setting the detecting distance. This type of setting is intended for detection not susceptible to the background.

Applications: detection of object on conveyor, distinction between different heights or positions of objects

Setting procedure

- 1) Set the ZONE/NOR selector switch to [NOR].
- 2) Set the SET/RUN selector switch to [SET].

The operation indicator (orange LED) starts flashing.

- 3) Provide the detection object at a place for distance setting with a margin taken into consideration and press the SET button twice.

The stability indicator (green LED) is illuminated when the SET button is pressed for the first and second times alike.

Release the SET button when the stability indicator (green LED) is illuminated.

Note: Holding down the button enables the maximum distance teaching mode.

When the SET button is released, the stability indicator (green LED) stays illuminated and the operation indicator (orange LED) starts flashing.

Pressing the SET button twice sets the distance.

- 4) Set the SET/RUN selector switch to [RUN].

Operation

- The detecting range is within the set detecting distance.
- The activation position is $\pm 5\%$ with reference to the position of the detection object used for the teaching.
- Set the operation mode by selecting between L.ON and D.ON.

Notes

- When the SET button is pressed 3 or more times, the last two teaching operations overrides the previous operations for teaching.
- If the SET button is pressed at different positions for the first and second teaching operations, the activation position is set midway between the distances set by the first and second teaching operations.

The detecting range is between the activation point and the sensor.

(3) ZONE mode teaching and applications

A detection zone is set within the sensor detecting distance.
Applications: detection of object in a range between two points at different distances from the sensor disregarding the farther and nearer ranges or provision of a non-detection zone within the detecting distance

Setting procedure

- 1) Set the ZONE/NOR selector switch to [ZONE].
- 2) Set the SET/RUN selector switch to [SET].
The operation indicator (orange LED) starts flashing.

- 3) Provide the detection object at a distance on the farther boundary of the intended detecting range and press the SET button.

The stability indicator (green LED) is illuminated when the SET button is pressed.

When the SET button is released, the stability indicator (green LED) stays illuminated and the operation indicator (orange LED) starts flashing.

The first teaching point has been set.

- 4) Provide the detection object at a distance on the closer boundary of the intended detecting range and press the SET button.

While the SET button is pressed, the operation indicator (orange LED) is not illuminated and only the stability indicator (green LED) is illuminated.

When the SET button is released, again the stability indicator (green LED) stays illuminated and the operation indicator (orange LED) starts flashing.

The second teaching point has been set.

(Teaching may be started at either the farther or closer boundary.)

- 5) Set the SET/RUN selector switch to [RUN].

Operation

- The detecting range is the limited zone between the farther and closer boundaries.

- L.ON/D.ON setting and operation
 L.ON : activated within the detecting range
 D.ON : activated outside of the detecting range

Notes

- Set the closer boundary at within 80% of the farther boundary setting.
- When the SET button is pressed 3 or more times, the last two teaching operations overrides the previous operations for teaching.

(4) Maximum distance (default setting) teaching

The sensitivity is set at maximum for detection.
Applications: extension of the detecting distance as much as possible to make the most of the maximum detecting distance of the sensor when no background object (reflecting object such as wall and conveyor) is present

Setting procedure

- 1) Set the ZONE/NOR selector switch to [NOR].
- 2) Set the SET/RUN selector switch to [SET].
The operation indicator (orange LED) starts flashing.

- 3) Press and hold down the SET button for 3 seconds or longer.

- (1) When the button has been held down for 1.5 seconds, the operation indicator (orange LED) stops flashing and stays illuminated.

- (2) When the button has been held down for another 1.5 seconds, the stability indicator (green LED) is illuminated. Release the SET button.

- (3) The setting is complete.

- (4) Set the SET/RUN selector switch to [RUN].

Operation

- The maximum detecting distance of the sensor is enabled for detection of objects.

Note

- The detecting distance may be shorter than the maximum allowable teaching distance with the background or object present.

Teaching error

The error indicator [ERR] (red LED) is illuminated or flashes if any error occurs during teaching. The error is reset when successful teaching has been completed.

○NOR mode teaching

- Possible cause: no detection object present or insufficient light reception
- Indicator operation

• SET button pressed			• SET button released		
O.P. illuminated	STB not illuminated	ERR illuminated	O.P. flashes	STB not illuminated	ERR illuminated

(Note: Holding down the button enables the maximum distance teaching mode.)

- Correction: Adjust the distance between the sensor and the detection object or background and perform teaching operation (distance setting) again.

○ZONE mode teaching

- Possible cause: no detection object present, insufficient light reception or insufficient interval between 2 points
- Indicator operation

• SET button pressed			• SET button released		
O.P. illuminated	STB not illuminated	ERR illuminated	O.P. flashes	STB not illuminated	ERR flashes

- Correction: Adjust the distance between the sensor and the detection object or background or between 2 points and perform teaching operation (distance setting) again.

For Correct Use

Be sure to follow the instructions in the operation manual provided for correct use of the product.

Notes on installation and countermeasures

	Notes	Countermeasures
	<p>Some limitations apply regarding the orientation of the sensor and direction of the movement of the detection object. However, up-down movement is allowed within the set detecting distance.</p>	<p>Note the installation and direction of movement of the object as shown in the figure when installing the sensor.</p>
	<p>In the NOR mode, faulty operation may occur when the object moves outside of the sensor detecting range (farther boundary).</p>	<p>Provide background (wall or object not to be detected) outside of the detecting range (farther boundary) for preventing faulty operation.</p>
	<p>In the ZONE mode, faulty operation may occur when the object passes outside of the sensor detecting range (closer boundary) if the farther boundary of the detecting zone is set close to the background (wall or object not to be detected).</p>	<p>Remove the background object or use the on-delay timer.</p>
	<p>Detection may be unstable if any glossy floor or conveyor is present under the sensor.</p>	<p>Mount the sensor at an angle or leave a gap of 200 mm or longer between the sensor and the object underneath.</p>
	<p>Faulty operation may be caused by a slight angle variation when any mirror-like or glossy object (in the background) is present on the side of the farther boundary.</p>	<p>Mount the sensor at an angle and check the operation with the detection object.</p>

- A dead zone may be generated on the closer side depending on the type of detecting object.
- Ensure that no strong beam of sunlight, fluorescent or incandescent lamp, etc. enters the operating range of the sensor.

- Do not use the sensor for detection for protection of human body.
- For safety applications, ensure safe operation of the detection and control system as a whole.
- This product is not explosion proof.

Rating/Performance/Specification

Model	DX-7AH	
Detecting distance	0.5-7.5m (*1)	
Standard detecting object	700×700mm white drawing paper	
Power supply	12-24V DC ±10% / Ripple 10% max.	
Power consumption	2.3W max.	
Analog output	Current output	4-20mA±10% (allowable load resistance: 250 Ω max.)
	Resolution	±5%F.S. max. (*2)
	Linearity	10%F.S. max
	Response frequency	About 20Hz
Comparator output	Output mode	NPN open collector Sink current: 50 mA (30 VDC) max. / Residual voltage: 2 V or less
	Response frequency	About 20Hz
	Mode switching	Light-ON/Dark-ON selectable
	Load short circuit protection	Provided
Anti Interference	Provided Master/slave setting	
Light source (wavelength)	Infrared LED (870nm)	
Switch (SW)	Pushbutton switch×3	
Teaching method	Auto teaching (for comparator output only)	
Teaching mode	1-point normal teaching, 2-point normal teaching, 1-point zone teaching	
Material	case	Aluminum (alumite finish)
	Front/back panel	ABS resin
	Lens	Polycarbonate
	Lens front cover	Polycarbonate
Connection	6-pin waterproof plastic connector	
Mass	About 200 g	
Accessory	Cord with connector (*3), 250-Ω resistor for current-voltage conversion, operation manual	

*1 Note that any object with high reflectance at a distance of 40-80 m may cause faulty operation.

The comparator output is designed for a distance of 0.5-7 m.

*2 Output of higher resolution may be available by averaging or integration.

*3 0.2 mm²×6 cores, 2 m (outer diameter: 5 mm)

Environmental Specification

Model	DX-7AH
Ambient light	5000 lx max. (on light receiving surface)
Ambient temperature	-10 - +55 °C (non-freezing)
Ambient humidity	35-85%RH (non-condensing)
Protective structure	IP65
Vibration	10-55 Hz / 1.5 mm amplitude / 2 hours each in 3 directions
Shock	500 m/s ² / 3 times each in 3 directions
Dielectric withstanding	1,000 VAC for 1 minute
Insulation resistance	500 VDC, 20 M Ω or higher

- Do not use the sensor for detection for protection of human body.
- For safety applications, ensure safe operation of the detection and control system as a whole.

Characteristics (Typical Example)

• Activation area characteristics

With no background

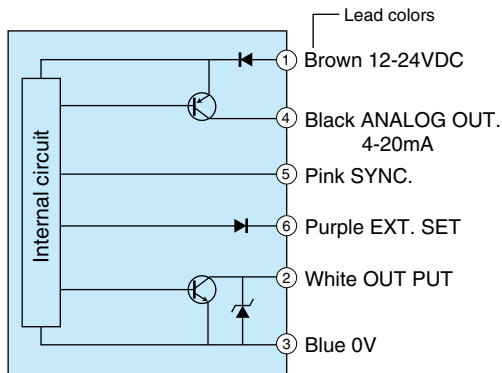

• Distance-output characteristics

Standard detecting object
700×700mm white drawing paper

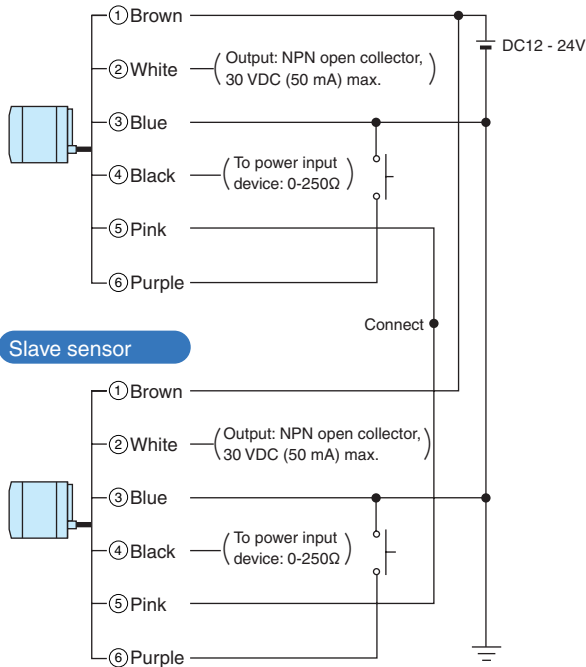

DX-7

Input/Output Circuit and Connection

- When not using the EXT.SET line (purple), connect it with the power supply (+ V).
- For standalone use without enabling the Anti Interference, connect the (5) SYNC. line (pink) with the GND.

Master sensor

Slave sensor

Operation Chart

Analog output

Current output of 4-20 mA available for detecting distance of 0.5-7.5 m.

NOR mode setting

Sensor activated/deactivated at setting.

1-point ZONE mode setting

Caution

If any background (wall, etc.) is present at a distance of 8-30 m from the sensor, a work that passes through the detecting range may cause:

- Output of a value for a closer point than the correct analog value on the edge of the work when the analog output is used.
- Transient activation on the edge of the work when the comparator output is used.

Teaching Modes for Different Detecting Situations

Detecting situation	Detection of work at specific position	Detection by setting threshold between background and work	Detection of glossy work on this side of background by setting threshold only with background
Teaching	1-point normal teaching	2-point normal teaching	1-point zone teaching (may be performed externally)
Method	Teaching with work provided at intended point of detection	Teaching with background and work	Teaching with background (conveyor, ground, etc.)
Threshold	Threshold a1 set at position of teaching	Threshold a2 set midway between background and work	Thresholds a and b set at about $\pm 5\%$ with reference to distance to background
Operating range			

Outline of Teaching Procedure

- 1-point normal teaching/2-point normal teaching

Procedure	Operation	
	1-point normal teaching	2-point normal teaching
(1)	Provide the detecting object at the intended position.	Provide the detecting object
(2)	Press and hold down Button 2 until the RUN indicator (green) starts flashing (for about 3 seconds). 	Press and hold down Button 2 until the RUN indicator (green) starts flashing (for about 3 seconds).
(3)	Press Button 2 again with the object kept at the position (for about 0.5 seconds). 	Move the detection object and press Button 2 (for about 0.5 second).

- 1-point zone teaching/external teaching

Procedure	Operation
(1)	Direct the detecting side of the sensor toward the background (conveyor, ground, etc.).
(2)	Press and hold down Button 3 (external switch for external teaching) until the RUN indicator (green) and MODE/ERR. indicator (red) start flashing alternately (for about 3 seconds).
(3)	Press Button 3 (external switch for external teaching) once again (for about 0.5 seconds).

- This type of teaching is used for teaching only with the background or detecting a glossy work on this side of the background.
- The glossy work is recognized as being on that side of the background for detection.

DX-7

Indicators and Set Buttons (Sensor Rear Panel)

Light-ON/Dark-ON Mode Setting

- (1) The MODE indicator (red) turns on and off every time the button is held down for about 3 seconds.

Master/Slave Mode Setting

Procedure	Operation
(1)	Supply power while holding down Button 3. 
(2)	Release Button 3.
(3)	The slave mode has been enabled. Repeating the above steps alternates between the master and slave modes. RUN illuminated: master mode RUN not illuminated: slave mode

Dimensions (in mm)

Body

With mounting bracket DX-B1 (optional) attached

With mounting bracket DX-B2 (optional) attached

- Self-diagnosis feature

- Sensor signaling an error due to degradation of receiver light intensity level
- Feature applicable to countering soiling of lens or light axis misalignment over time, allowing easy maintenance

- IP 67 water resistance allows washing

Sensor when line is washed

- Visible beam spot for ease of checking (red LED type)

Type

For Correct Use

Be sure to follow the instructions in the operation manual provided for correct use of the product.

Stability output

The stability output can be used to check for reduction of the light intensity level along with any change in the operating environment or operation over time or to perform initial check of the operation.

When detection has occurred with the level of received light exceeding the operation level but not reaching 120% of the level (range allowing stable operation), the stability signal is output when the control output is deactivated.

Indicators

- The operation indicator (red LED) and stability indicator (green LED) show the levels of light intensity as described in the figure on the right.
- After aligning the optical axis, use a detection object to block and unblock the light beam several times to make sure that the sensitivity level is in a range that allows stable activation and deactivation.
- Setting the sensitivity in a range allowing stable operation achieves higher reliability against changes in the operating environment generated after the sensitivity is set.

- The red LED (OP.L) is the operation indicator. In the L.ON (Light-ON) mode, the indicator is illuminated when a certain amount of light is detected. In the D.ON (Dark-ON) mode, the indicator is illuminated when a certain amount of light is not detected.

Light-ON/Dark-ON switching

For Light-ON mode: Set the switch to L (Light).
For Dark-ON mode: Set the switch to D (Dark).

Detecting direction

The 2-division photodiode has directionality and the sensor may not be used in a certain direction. The direction of movement of the object must be as shown in the figure.

Prohibited direction
*Up-down movement shown in the figure may be allowed within the detecting distance set with the distance adjustment.

Background

Any glossy or mirror-like object present in the background of the detection object may cause faulty operation depending on the angle of the background. In such cases, mount the sensor at an angle.

- High-intensity red LED for ease of light axis adjustment <DL-S100R (-J)>
- Light intensity for long distance offering adverse environment
- Compact size and enhanced functions
- IP 66 protective structure

Type

Type	Detecting distance	Model	Operation mode	Output mode	Power supply

Special mounting bracket	AC-BDL1	Vertical mounting
	AC-BDL2	Back mounting
Cord with M8 connector	FBC-4R2S	Straight
	FBC-4R2L	Angled

● Panel display and functions

Operation indicator (red)

Illuminated when output is activated. High-intensity red LED for excellent visibility.

Stability indicator (green)

Illuminated when received light intensity is about 120% of operation level or higher. Use of the sensor at an operation level allowing illumination of the stability indicator ensures stable detection.

Light-ON/Dark-ON selector switch

Turn the switch to L.ON or D.ON for Light-ON or Dark-ON mode respectively.
Be sure to turn all the way to the end.

Distance setting indicator

The position on the distance setting scale is shown in accordance with the 5-turn sensitivity adjustment, allowing easy reading of setting during fine-tuning.

Distance adjustment

5-turn adjustment is employed for easy fine-tuning of detecting position. Turn to FAR or NEAR for longer or shorter detecting distance respectively.

Rating/Performance/Specification

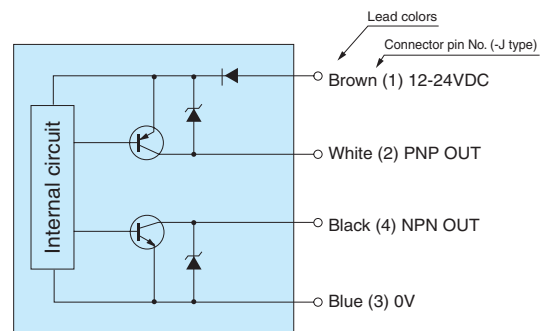

Model	DL-S100R	DL-S100R-J	DL-S202(R)	DL-S202-J

Environmental Specification

Ambient light	Sunlight: illumination on light receiving surface 10,000 lx max. Incandescent lamp: illumination on light receiving surface 3,000 lx max.
Ambient temperature	-25 - +55°C (non-freezing)
Ambient humidity	35-85%RH (non-condensing)
Noise	Power supply line: 250 V / Cycle: 10 ms / Pulse width: 1 μs Radiation: 1 kV / Cycle: 10 ms / Pulse width 1 μs (with noise simulator)
Protective structure	IP66
Vibration	10-55 Hz / 1.5 mm amplitude / 2 hours each in 3 directions
Shock	500 m/s ² / 3 times each in 3 directions
Dielectric withstanding	1,000 VAC for 1 minute
Insulation resistance	500 VDC, 20 MΩ or higher

Input/Output Circuit and Connection

- The output transistor turns off when load short circuit or overload occurs. Check the load and turn the power back on.

Distance detection with 2-division photodiode

While ordinary reflective-type sensors operate based on the received light intensity, sensors with 2-division photodiode judge distances based on the angle of the received light.

This makes sensors with 2-division photodiode to be less susceptible to variation in the received light intensity due to change of the color or material of the detection object, reflection on the background or soiling of the sensors, allowing stable detection.

Detection based on change of angle of received light according to change of distance from detection object.

DL-S

Model: DL-S100R Characteristics (Typical Example)

For Correct Use

Be sure to follow the instructions in the operation manual provided for correct use of the product.

• Detecting direction

The 2-division photodiode has directionality and the sensor may not be used in a certain direction. The direction of movement of the object must be as shown in the figure.

Permitted direction

Prohibited direction

Up-down movement shown in the figure may be allowed within the detecting distance set with the distance adjustment.

• Background

Any glossy or mirror-like object present in the background of the detection object may cause faulty operation depending on the angle of the background. In such cases, mount the sensor at an angle.

• Stability indicator

The stability indicator does not show the margin of distance but intensity of light with reference to the operation level. The distance at which the indicator is illuminated/not illuminated may vary depending on the reflectance of the detection object. Situations in which the stability indicator is not illuminated may cause unstable detection.

- Do not use the sensor for protection of human body.
- For safety applications, ensure safe operation of the detection and control system as a whole.

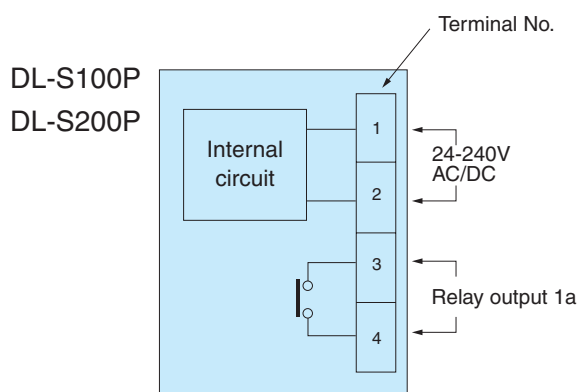

- Long distance 1 m, 2 m
- Terminal block offering fully open space for wiring

Comparator Output Adjustment (DLA-S300, -S1000, DSM-500)

Provide the detection object at the intended position and turn the adjustment for CH 1 until the LED for CH 1 is illuminated. CH 1 stays activated at the position or closer to the sensor. Adjust CH 2 in the same way.

Indicator and adjustment for CH 2 comparator adjustment (for long range)
Indicator and adjustment for CH 1 comparator adjustment (for short range)

Distance-Output Characteristics (Model DSM-500)

The plot at the center of the chart shows typical output characteristics. The range marked by the lines above and below shows that the output variation among different products is within the range. While the output at the same distance may vary within this range depending on the product, there is little output variation in repetitive operation of one product.
