SERIES 39L

HIGH PERFORMANCE BUTTERFLY VALVE FOR HIGHLY EROSIVE SLURRY CONTROL

SIZE RANGE
50nb-500nb (2"-20")

WAFER and FLANGED LONG BODY DESIGN, SINGLE OFFSET DISC

Bray Controls proudly offers the Series 39 high performance slurry control valve. The Series 39 has been designed to withstand the most highly erosive and abrasive services in alumina refining. It has also been successfully applied to other applications where control of erosive product is required.

The Bray Series 39 control valve is made to the highest standard from technically advanced wear resistant materials such as sintered silicon carbide ceramic, partially stabilized zirconia ceramic and special chrome-molybdenum iron. Therefore, Series 39 is the ultimate product for use on severely erosive slurry and abrasive applications.

Components from the patented Series 40 high performance valve are featured in the Series 39. Proven Series 40 parts, such as seals, packing and bearings, and the blow out proof stem design are utilized. Industry standard ISO actuator mounting top works allows for simple, standard on-site actuator fitment.

The Series 39 high performance slurry control valve delivers the highest quality and best value available to meet the requirements of today's fluid process industry.

BODY: In sizes 50nb to 150nb (2" to 6") a compact wafer style ductile iron body enables easy installation. In sizes 200nb (8") and larger double flanged bodies provide a method of installation and alignment more suited to larger, heavier valves. The larger size valves have lifting points provided on the body casting. 316 stainless steel bodies are available in some smaller sizes.

STEM: One piece high strength 17-4 PH stainless steel stems are used in all sizes. The valve stem is standardized to allow for interchangeability of Bray actuators.

DISC: The disc has been designed to maximize flow and minimize wear. The disc is available in chrome-molly iron or PSZ ceramic.

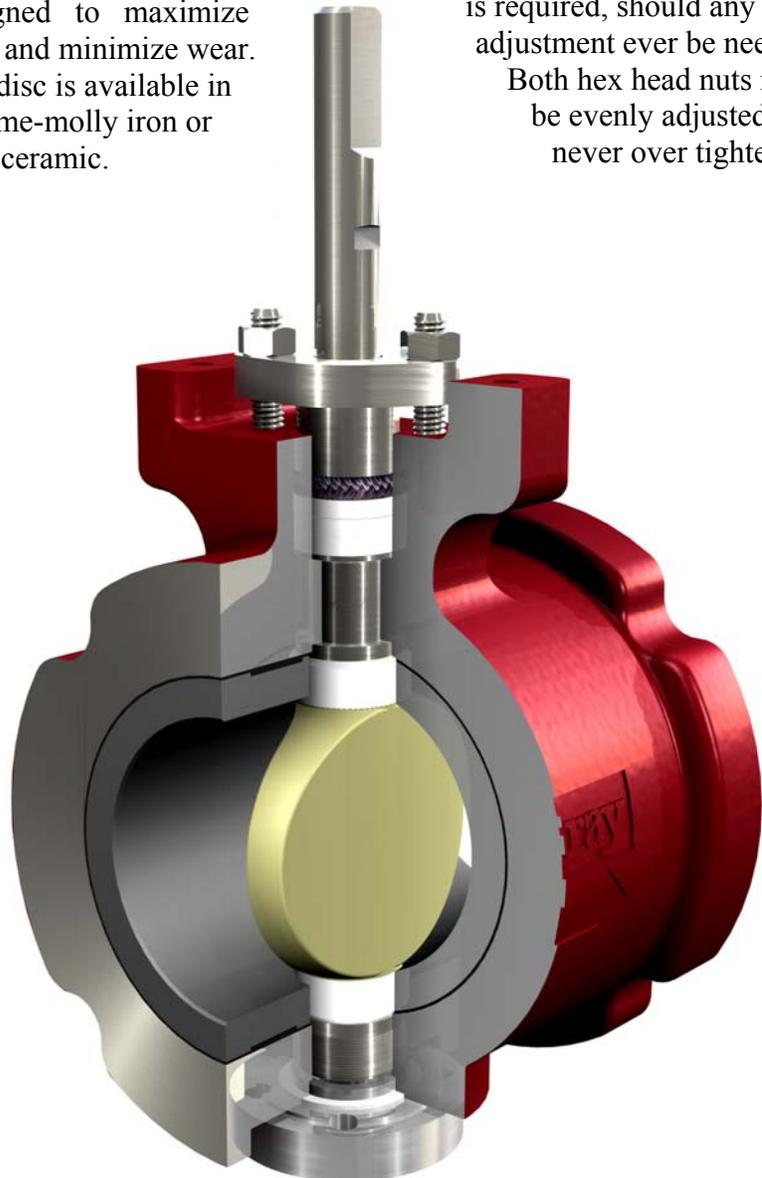

BLOW OUT PROOF STEM:

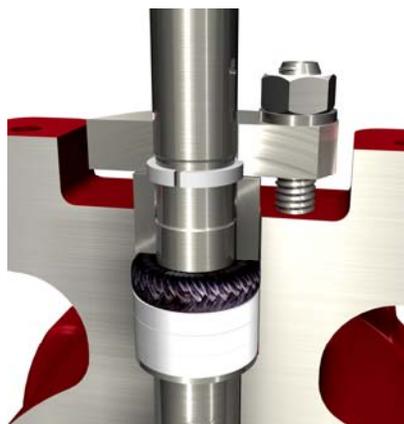

The Series 39 valve features blow-out proof stem protection. A retaining ring is installed between the machined stem groove and gland retainer step providing full retention of the stem in the unlikely event of internal stem failure.

ADJUSTABLE PACKING:

The stem packing features easy access to adjusting hex head nuts without requiring removal of the actuator. The system consists of studs, hex head nuts, lock washers, gland retainer, gland ring and seal rings. A slight quarter turn of the hex nuts is usually all that is required, should any field adjustment ever be needed.

Both hex head nuts must be evenly adjusted and never over tightened.

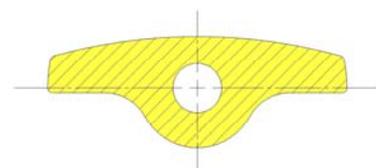

STEM SEAL: The stem seal system derived from the S40 provides a positive seal. PTFE packing seals the stem and a carbon fibre anti-extrusion ring contains the packing. Flexible graphite rings are available for high temperature applications. All Series 39 valves have one set of stem seal packing rings and a PTFE base cover gasket or O-ring seal in the body base.

STEM BEARINGS: The upper stem bearing has a 316 stainless steel shell with a TFE / glass fibre liner bearing surface. The lower stem bearing is PSZ ceramic. The upper and lower stem bearings provide excellent resistance to corrosion and distortion caused by mechanical loading and high temperatures.

SWING THROUGH DISC: As the Series 39 is a control valve only, the disc does not seat off on the liner. It can in fact swing through 360 degrees.

PSZ HUBS: The Series 39 disc is held in position by two cylindrical ceramic hubs. These hubs act as a running surface with minimal clearance to the disc, whilst allowing the disc to rotate.

SINGLE OFFSET DISC: The single offset disc is the heart of the Series 39 valve. A butterfly valve disc is most prone to wear in the first 25% of opening. The single offset disc design allows the disc to open the leading edge first (left side as pictured below). This in effect causes a larger opening in the foremost position of the valve, in turn allowing the high velocity fluid the most amount of distance to recover whilst still inside the ceramic lined valve. The operating fluid is also effectively deterred from accelerating across the front face of the disc minimizing wear in regions such as the upper and lower hubs.

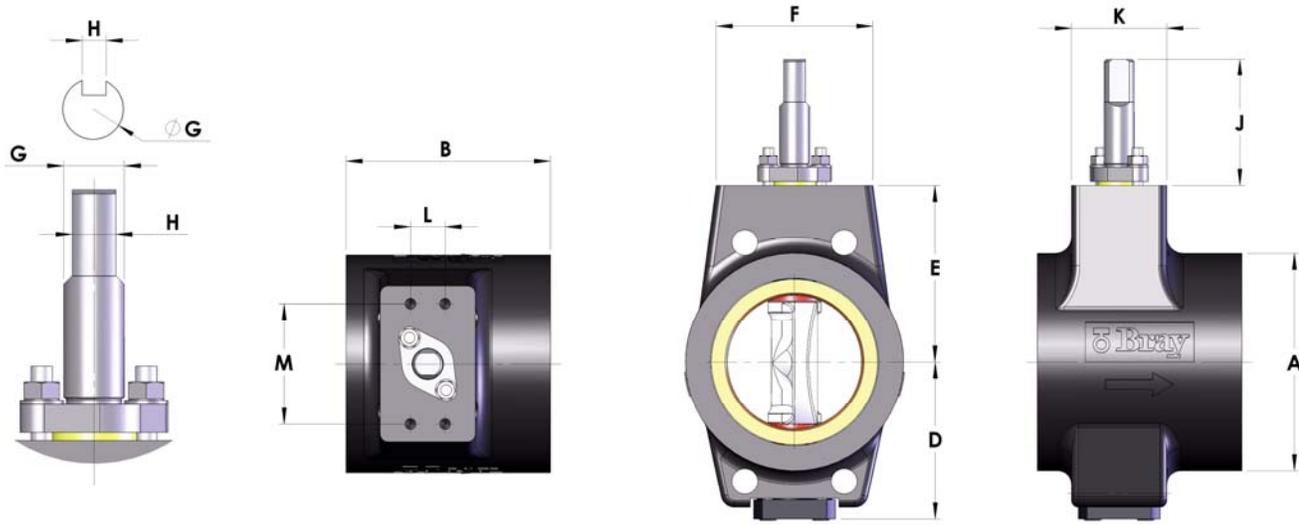

The disc is driven by either a hex or double D connection to the stem, which not only provides a means of easily servicing the stem and disc, but importantly eliminates any torque transmitting drive components being directly in contact with the abrasive process fluid.

CERAMIC LINER: The series 39 liner is made from Sintered Silicon Carbide Ceramic. The Vickers hardness of S-SiC Ceramic is 2,460 meaning the internal liner in the Series 39 valve is extremely durable. In most applications the liner will outlast the hard wearing single offset disc (iron or ceramic). Therefore, not only is the valve long lasting, but maintenance is very cost effective as only a minimal number of parts, such as the disc, stem, bearings and stem seals, should ever require servicing. The S-SiC liner is diamond ground to a very tight final tolerance and is bonded into the body with a chemical and heat resistant agent.

BASE PLUG & COVER: The opening in the base of the valve is sealed by a SS base cover. The base cover also locks the base plug at its final position after it has been adjusted. The base plug is responsible for providing the adjustable means to position and give clearance to the two PSZ hubs in relation to the disc and its position in the centre of the valve's bore.

DIMENSIONS

The above torque values are for:
 Normal: light to medium slurries
 Severe: medium to heavy slurries

MATERIALS OF CONSTRUCTION

MATERIALS

Item	Name	Material
1	Body	Ductile Iron ASTM A395
		Stainless Steel ASTM A351 CF8M
2	Disc	Chrome-Molly Iron (Hardened) PSZ Ceramic (Partially Stabilized Zirconia)
3	Stem	17-4 PH SS ASTM A564-Type 630
4	Liner	S-SiC Ceramic (Sintered Silicon Carbide)
5	Upper Hub	PSZ Ceramic (Partially Stabilized Zirconia)
6	Spacer	316 Stainless Steel ASTM A276-Type 316
7	Bearing	316 Stainless Steel with TFE & Glass Fabric Liner
8	Thrust Washer	316 Stainless Steel ASTM A276-Type 316
9	Stem Seal	PTFE Rings, plus 1 x Carbon Fibre Top Ring
10	Gland Ring	316 Stainless Steel ASTM A276-Type 316
11	Retaining Ring	18-8 Stainless Steel
12	Stud	316 Stainless Steel ASTM A193-B8M
13	Gland Retainer	316 Stainless Steel ASTM A276-Type 316
14	Lock Washer	18-8 Stainless Steel
15	Hex Nut	18-8 Stainless Steel

16	Lower Hub	PSZ Ceramic (Partially Stabilized Zirconia)
17	Stem Retainer	Tool Steel
18	Base Plug	316 Stainless Steel ASTM A276-Type 316
19	Gasket	PTFE
20	Base Cover	316 Stainless Steel ASTM A276-Type 316
21	Cap Screws	18-8 Stainless Steel

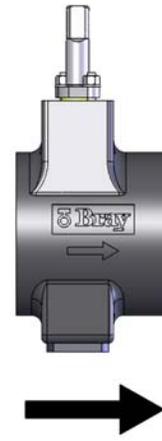

Other materials are available. Please consult factory for your specific application

Valves in sizes greater than 150nb (6") have the following additional components:
 -AFLAS O-Ring and 316SS washer located between Upper Bearing and Spacer.
 -316SS Stem retention assembly c/w PEEK thrust washers in lieu of tool steel rings.
 Where required, standard ISO mounting bracket: 18-8 St Steel or Carbon Steel.

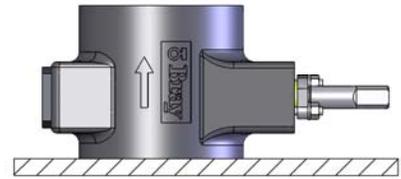

DIRECTION OF FLOW:

The Series 39 long bodied control valve is designed to provide a longer distance down stream of the disc centreline than upstream. The longer distance downstream is to allow for recovery of turbulent flow before the process fluid re-enters the pipe work. Therefore, the valve needs to be installed so the direction arrow (that is cast on the side of the valve) is in line with the direction of flow. It is also important to make sure that the disc is positioned correctly in the relation to the direction of flow prior to fitting actuation (which is clearly outlined in the installation and maintenance instructions).

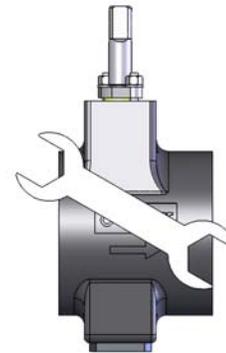

PROTECTING FLANGE CONNECTION FACES:

To keep the flange connection surfaces free from any damage or any irregularities that may cause sealing problems during installation, it is essential that a valve is not laid on rough surfaces or dropped on these sealing faces. This can seriously damage the machined face or ceramic lining of the valve. During transportation it is recommended that these flange connection faces are protected by covers and ideally not packaged with the valve resting on a flange connection surface.

INSTALLATION AND MAINTENANCE INSTRUCTIONS:

Before installing or performing any maintenance on the series 39 valve, it is strongly recommended that the procedures laid out in the installation and maintenance instructions be followed. There is no requirement for special tools to perform disassembly or reassembly maintenance on the Series 39 valve. Spare parts are available from your Bray distributor.
