

Power Supplies 3U and 6U

VPX Power 3U / 6U

1 Power Supply 3U 4TE 715W, DC/DC, conduction cooled

1.1 Key Features

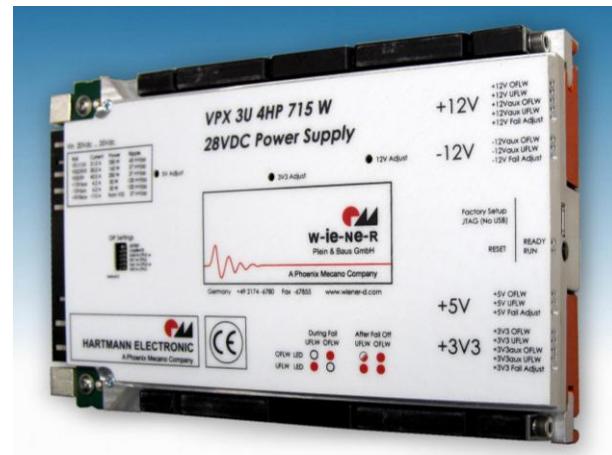

- Compliant to VITA 62 baseline specification
- Up to 715 Wmax. Power *
- 600 W over all
- up to 21A for +12V :VS1
- up to 50A for +3.3V :VS2
- up to 40A for +5V :VS3
- +12V / -12V AUX 4.2A
- +3V3 AUX 7A
- up to 92% efficiency
- -40 to +85°C Operating Temperature **
- Voltage sense controlled ***
- 18 – 35 V DC INPUT

* Derating: ~2% Wattage per Kelvin from 40°C on **

** At hottest outer case temperature / wedge lock edge temp. values in work

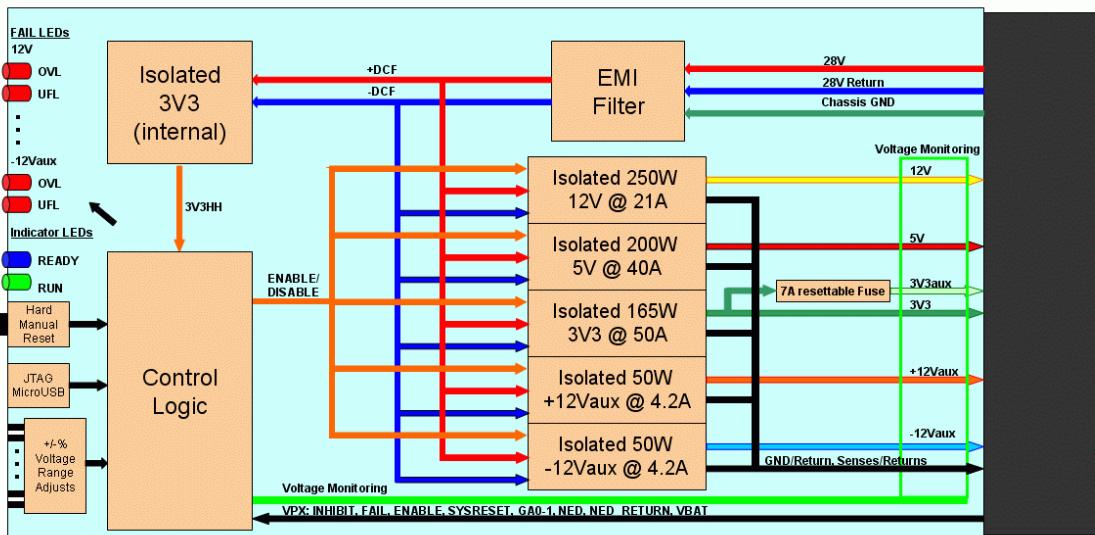

*** Over Voltage, Under Voltage, Over Current, Over Temperature
Shutdown control over each power rail, common control via VITA62 control bus

- Storage Temperature: -40°C to +100°C
- Weight: 0.6kg/1.23 Lbs
- Isolation Voltage: 500V

Order Number: D575.00700

1.1.1 Block diagram

VPX Power 3U / 6U

Figure 1 Block diagram 3U

All voltage ZVS converters are isolated (1500V isolation voltage) and fed via a common Filter Network from the same 28V main supply (18V – 35V, shortly 36V). 3V3aux is not independent but protected by a resettable fuse (PTC). All individual output voltages (6x) are sensed by window comparators for over- and under voltages which are monitored from a central control logic device (CPLD). Any failure on the output voltages are signaled on the front panel by corresponding FAIL LEDs and lead to a switch off of all voltages (by default). If all internals are normal the blue READY LED is working. Figure 1 show gives an overview over the front panel elements.

1.1.2 Front panel

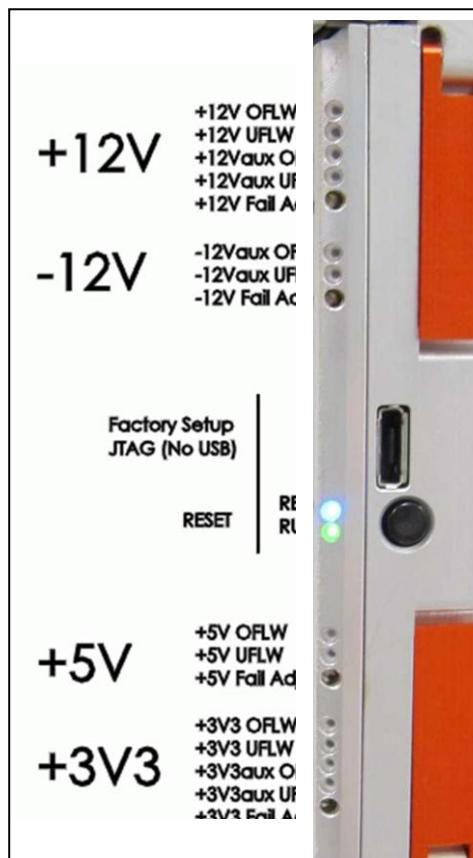

Figure 2 Front panel functional elements of the VPX3C Power Supply

1.1.3 Control Logic:

Depending on the main bus signals also the green RUN LED goes on and the power supply tries to start working. According to VITA 62 and VITA 46 the logic *run line condition* is – when “#” is nomenclature for the negative logic main bus signals, logic negation is signaled by the “¬” sign, and a positive logic transition by “↑”:

$$\begin{aligned} \text{RUN} = & (\neg \#ENABLE \text{ AND } \#INHIBIT \text{ AND } \#FAIL \text{ AND } \neg \text{INTERNAL_FAIL}) \\ & \text{“REFRESHED AFTER FAIL WHEN”} \\ & \uparrow (\neg \#SYSRESET \text{ OR } \neg \#RESET_BUTTON \text{ OR } \text{POWER_ON}) \end{aligned}$$

This means that if the global inhibit is not set (= released to H), whether no internal or external failure occurs (both are released to H) the power supply starts. After some kind of failure (internal or external) the power supply restarts by one of the following three conditions: A power cycle, a push onto the front panel button or a remote reset via the main bus system reset (#SYSRESET).

VPX Power 3U / 6U

By default all voltages go down promptly if one of the run line conditions is not met. When an internal failure occurs the delay or failure hold time to a complete switch off of the power supply is a half second to a second. This logic prevents any hardware from defects caused by unsymmetrical power faults (analogue operational circuits) or partial power faults (CPUs).

1.1.4 Failure LEDs:

To know exactly the reason of the last failure two fail LEDs on the front panel for every voltage will indicate the origin. Window discriminators directly steer the upper or lower LEDs if over- or under voltage actually takes place (OFLW, UFLW). This actual state can be watched shortly before the failure hold time is reached and/or by flickers of the corresponding LEDs. If the failure origin lasts longer than the hold time the power supply shuts down.

After a shutdown all under voltage LEDs must go on showing that no power is online. Now it is easily possible to distinguish where an over- or under voltage failure occurred: A steady overvoltage LED at the corresponding power rail shows an over voltage problem, a blinking overvoltage LED an under-voltage problem. Largely under-voltage is caused by over current or over heat of the corresponding power rail. Figure 2 gives the list of failure interpretations.

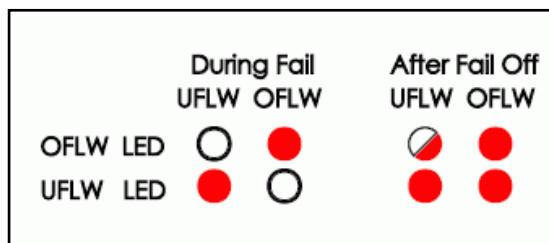

Figure 3 Failure LED failure origin interpretation

The +/- window range of the power rail is adjusted by factory to +/- 5..7 % and may be carefully readjusted by the named front panel trimmer elements (+/- 0%..50%).

After origin of failure has removed a reset restarts the module.

1.1.5 Technical Specification

Form Factor	3U VPX CC
Pitch	4HP / 0.8 inch
Weight	0.6 kg / 1.23 Lbs / 21.2 oz.
Storage Temperature	-55°C to 105°C
Operating Temperature	-40°C to 85°C
Input to Output Insulation	1500V
Input to Output Isolation with Case	550V
Input to Case Ground Isolation	500V
Output to Case Ground Isolation	50V
Case Ground to Safety Ground Resistance	< 10 mΩ
Main Power	
Maximum Output Power	715W
Maximum Input Power	~760W
Maximum Dissipated Power @ max. Power	~45W
Minimum Turn ON Voltage	20 V
Minimum Turn OFF Voltage	19 V

1.1.7 Switch-On Behavior

All voltage outputs are switched on exponentially with relatively slow rise times of 30-80 ms and do settle smooth to the final voltage without any overshoot or glitch.

VPX Power 3U / 6U

2 Power Supply 3U 10HP 600W, AC/DC, air cooled

2.1 Key Features

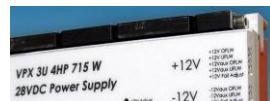

- Form factor: 3 U/10HP
- Efficiency: up to 89%
- Input Frequency: 47-63Hz
- Input Voltage: 85 – 264Vac
- Input Current: 6A (600W output at 120Vrms input)
- Inrush Current: 20A (at 265Vrms)
- Output Voltage: 12V/28A: VS1
3.3V/19A: VS2
5V/25A: VS3
±12VAUX/1A
3V3AUX/6A
- Isolation Voltage: Input to Output:4000Vac
Input to Chassis: 1500Vac
Output to Chassis 250Vdc
Output to Output 250Vdc
- Cooling with low noise Fan installed

Order Number: D575.00641
