Note 1: Guaranteed by design.

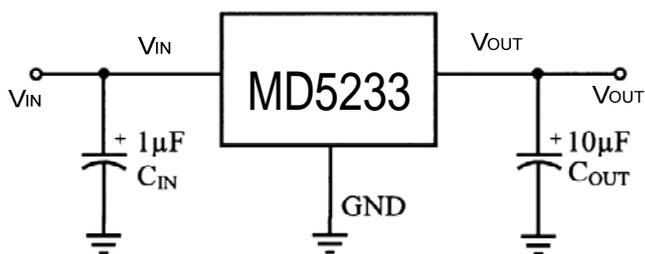

Note 2: Regulation is measured at constant junction temperature, using pulsed ON time.

Note 3: Current Limit is measured at constant junction temperature, using pulsed ON time.

Note 4: Dropout is measured at constant junction temperature, using pulsed ON time, and the criterion is V_{OUT} inside target value±2%.

Note 5: Dropout test is skipped at the condition of V_{IN}<3V.

■ TYPICAL APPLICATION CIRCUIT

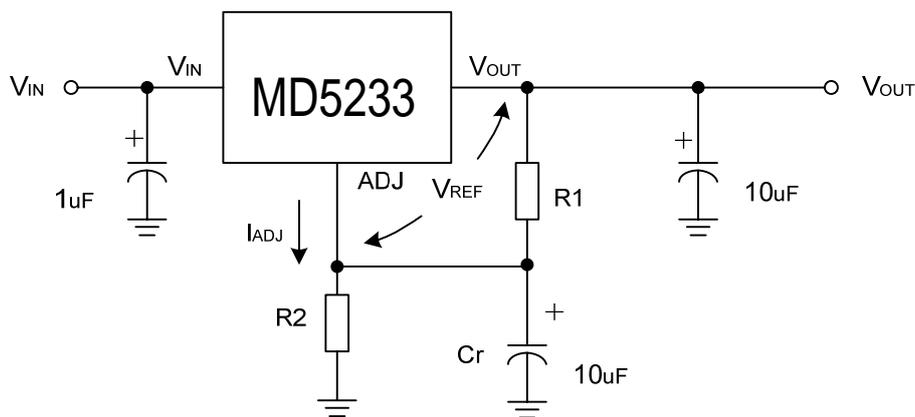

■ APPLICATION INFORMATION

A 10µF (or larger) capacitor is recommended between V_{OUT} and GND for stability. The part may oscillate without the capacitor. Any type of capacitor can be used, but not Aluminum electrolytics when operating below -25°C. The capacitance may be increased without limit.

A 1µF capacitor (or larger) should be placed between V_{IN} to GND.

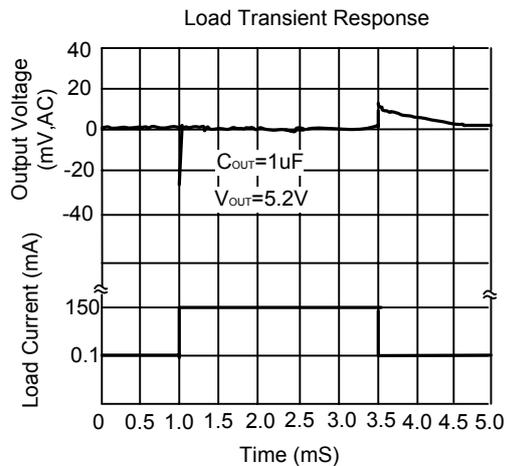

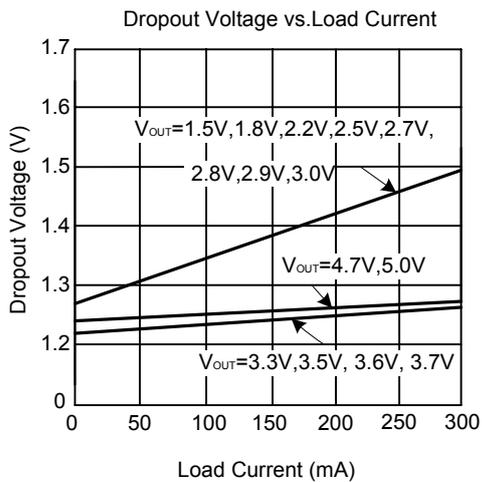

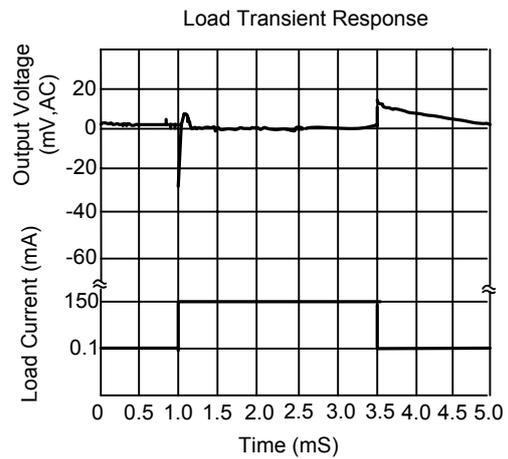

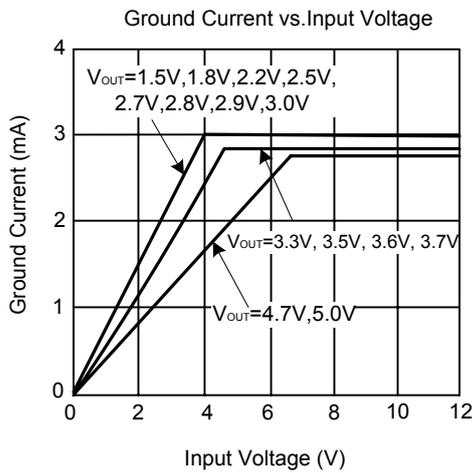

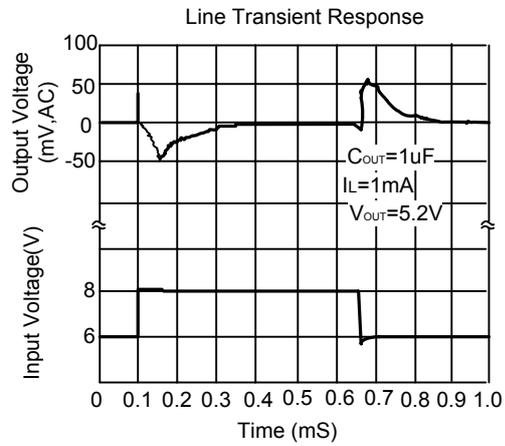

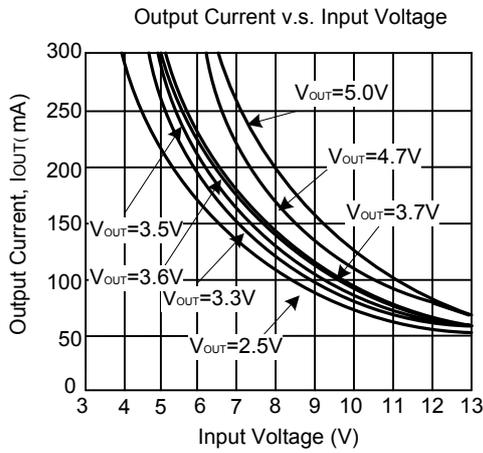

MD5233/A ADJUSTABLE

Cr:10uF to improve ripple rejection

$$V_{OUT} = V_{REF}(1 + R2/R1) + I_{ADJ} * R2$$
