

■ General Description

The MST1163 is a monolithic device intended for building a complete flashing unit for two wheel vehicles. The device is connected between the battery positive terminal (VCC pin) and a mechanical switch to the right and/or left bulbs. As soon as the series switch connects the OUT pin to the bulbs, the device begins to turn on/off with a 50% duty cycle. An external capacitor connected between the CEXT pin and the OUT pin stores energy for powering the device during the ON phase. When a low load is detected (output current lower than Idf), flashing frequency is automatically doubled.

■ Features

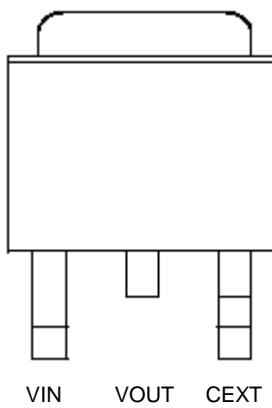

- Complete direction indicator in a 3 pin package
- Double frequency flashing in low load conditions
- Cycle by cycle over temperature shutdown
- Break down voltage up to 51V
- On chip oscillator ensures stable flashing frequency
- Over current protection
- Thermal shutdown protection
- On resistance as low as 60 mohm typical
